

WEDFLIX

DNS Mapping Guide

Map wedflix.qpix.co.in to the production Cloud Run service

For: Operations / DevOps Assistant

Estimated time: 30–45 minutes (incl. 5–15 min SSL wait)

1. Overview

This guide walks you, step by step, through mapping a custom domain to the WEDFLIX application that is currently running on Google Cloud Run. After completion, users will be able to access the platform at the friendly URL below instead of the long Cloud Run URL.

Final URL after setup	https://wedflix.qpix.co.in
Current (working) URL	https://wedflix-937423631598.asia-south1.run.app
Estimated total time	30 to 45 minutes (most of it is automatic waiting)

What you will be doing — quick map

1. Prove to Google that you own qpix.co.in (Search Console verification).
2. Tell Cloud Run: “send traffic for wedflix.qpix.co.in to the wedflix service.”
3. Tell Cloudflare DNS where to point wedflix.qpix.co.in.
4. Wait while Google automatically issues a free SSL certificate.
5. Open <https://wedflix.qpix.co.in> in a browser and confirm it loads with a valid padlock.

2. Required Access

Before you begin, make sure you have logins for the three systems below. The same Google account must be used in both Cloud Console and Search Console — otherwise the verification will not connect to the right project.

Google Cloud Console	The web UI for the GCP project that hosts WEDFLIX. Used in Phase 2 and Phase 4.
Google Search Console	Free Google tool for proving you own a domain. Used in Phase 1.
Cloudflare Dashboard	Where DNS records for qpix.co.in are managed. Used in Phase 1 and Phase 3.

⚠ IMPORTANT

Use the SAME Google account in Cloud Console and Search Console. If the account that verifies the domain is different from the account that owns the GCP project, Cloud Run will refuse to create the domain mapping with an error like “Domain not verified for this user.”

Key values you will type or paste

Custom domain to set up	<code>wedflix.qpix.co.in</code>
Apex / root domain	<code>qpix.co.in</code>
GCP Project ID	<code>project-0e5859f7-8749-4d47-bbf</code>
GCP Region	<code>asia-south1</code>
Cloud Run service name	<code>wedflix</code>
DNS provider	Cloudflare

Phase 1 — Verify domain ownership in Google Search Console

Goal: prove to Google that you control qpix.co.in. Cloud Run will refuse to issue an SSL certificate for a subdomain you do not own.

Time: about 10 minutes (most of it is waiting 2–5 minutes for DNS to propagate).

Step 1.1 — Open Google Search Console

1. Open this URL in a new browser tab:
<https://search.google.com/search-console/welcome>
2. Sign in with the Google account that has access to the WEDFLIX GCP project.

Step 1.2 — Add qpix.co.in as a “Domain” property

NOTE

You will see two panels: “Domain” on the left and “URL prefix” on the right. Always pick the LEFT panel (“Domain”). It covers all subdomains in one verification.

3. In the “Domain” panel on the left, type exactly: `qpix.co.in` (no `https://`, no `www.` — only the domain).
4. Click **Continue**.

Step 1.3 — Copy the TXT record Google shows you

5. Google will display a page titled “Verify domain ownership via DNS record” with a value like:

`google-site-verification=AbCdEfGhIjKlMnOpQrStUvWxYz0123456789`

6. Your actual value will look similar but different. Keep this Search Console tab OPEN — you will copy this value into Cloudflare next.

Step 1.4 — Add the TXT record in Cloudflare

7. Open a new browser tab and go to: <https://dash.cloudflare.com/>
8. Sign in to Cloudflare.
9. From the list of sites, click on `qpix.co.in`.
10. In the left sidebar, click **DNS** → **Records**.
11. Click the **Add record** button.
12. Fill in the form exactly as below:

Type	TXT
Name	@ (the @ symbol means the root domain qpix.co.in)
Content	Paste the entire <code>google-site-verification=...</code> value from Step 1.3.

TTL	Auto
-----	------

13. Click **Save**.

14. Wait 2 to 3 minutes for DNS to propagate. Take a quick coffee break.

Step 1.5 — Click Verify in Search Console

15. Switch back to the Search Console tab from Step 1.3.

16. Click the **Verify** button at the bottom of the panel.

IMPORTANT

If verification fails, wait another 5 minutes and click Verify again. DNS can occasionally take up to 10 minutes. Do NOT delete the TXT record after verification succeeds — leave it in place permanently.

DONE

Phase 1 done when Search Console shows “Ownership verified” with a green checkmark. Take a screenshot and send to the user before moving on.

Phase 2 — Create the Cloud Run domain mapping

Goal: tell Cloud Run that traffic for `wedflix.qpix.co.in` should be routed to the WEDFLIX service.

Time: about 5 minutes.

Step 2.1 — Open the Cloud Run service page

1. Open this URL in a new browser tab (use the same Google account from Phase 1):

<https://console.cloud.google.com/run/detail/asia-south1/wedflix?project=project-0e5859f7-8749-4d47-bbf>

2. If you see a project selector at the top, ensure the selected project shows: `project-0e5859f7-8749-4d47-bbf`
3. You should see a page titled “wedflix” with tabs across the top (METRICS, REVISIONS, LOGS, NETWORKING, ...).

Step 2.2 — Open the Custom Domains panel

4. In the Cloud Run navigation on the left side, look for a link called **Domain mappings** (sometimes called “Custom Domains”).
5. If you cannot find it, use this direct URL:

<https://console.cloud.google.com/run/domains?project=project-0e5859f7-8749-4d47-bbf>

6. Click **+ ADD MAPPING** (button near the top of the page).

Step 2.3 — Choose the service and domain

7. Under “Select a service”, choose: `wedflix`.
8. Click **CONTINUE**.
9. Under “Select a verified domain”, choose: `qpix.co.in` (the one you verified in Phase 1).
10. In the “Subdomain” field, type exactly: `wedflix`

IMPORTANT

Type only the subdomain part (`wedflix`), not the full `wedflix.qpix.co.in`. The form will combine them. The final domain shown should be `wedflix.qpix.co.in`.

11. Click **CONTINUE**.
12. Click **DONE** (or “SAVE”).

Step 2.4 — Copy the CNAME value Google shows

13. After saving, Cloud Run will display an “Update your DNS records” box with values similar to:

Name	<code>wedflix</code>
Type	CNAME
Value	<code>ghs.googlehosted.com</code> (or it may end with a dot:

	<code>ghs.googlehosted.com.</code> — both work)
--	---

14. Leave this tab open — you will need the Value in Phase 3.

✓ DONE

Phase 2 done when the Cloud Run Domain Mappings page lists `wedflix.qpix.co.in` (status will be “Certificate provisioning” — that is normal and expected at this stage).

Phase 3 — Add the CNAME record in Cloudflare

Goal: tell DNS to send traffic for wedflix.qpix.co.in to Google.

Time: about 2 minutes.

Step 3.1 — Open Cloudflare DNS

1. Go back to <https://dash.cloudflare.com/> and click on the `qpix.co.in` zone.
2. Left sidebar → **DNS** → **Records**.

Step 3.2 — Add the CNAME record

3. Click **Add record**.
4. Fill in the form EXACTLY as below:

Type	CNAME
Name	wedflixwedflix.qpix.co.in)
Target	ghs.googlehosted.com
Proxy status	DNS only ← gray cloud icon, NOT orange ☁
TTL	Auto

CRITICAL

Proxy status MUST be “DNS only” (gray cloud icon). If you leave it on “Proxied” (orange cloud), the site will return a 404 error and the SSL certificate will never finish provisioning. Click the cloud icon to toggle between the two — gray is what we want.

5. Click **Save**.

DONE

Phase 3 done when the CNAME row appears in the Cloudflare DNS Records list with a GRAY cloud icon next to it. Take a screenshot.

Phase 4 — Wait for SSL certificate provisioning

Goal: Google automatically issues a free Let's Encrypt SSL certificate for `wedflix.qpix.co.in`. You do nothing here except wait and verify.

Time: 5 to 15 minutes.

Step 4.1 — Wait

1. After saving the CNAME, wait 5 to 10 minutes. Do not skip ahead.

Step 4.2 — Check the status in Cloud Console

2. Open the Cloud Run Domain Mappings page:

<https://console.cloud.google.com/run/domains?project=project-0e5859f7-8749-4d47-bbf>

3. Find the row for `wedflix.qpix.co.in`.
4. The Status column will progress through these states:
 - “Certificate provisioning” (yellow)
 - “Routing traffic”
 - “OK” (green) — this is what you are waiting for.

Step 4.3 — If status is stuck on “Certificate provisioning” after 20 minutes

⚠ IMPORTANT

The single most common cause is the Cloudflare proxy being ON. Go back to Cloudflare DNS, find the `wedflix` CNAME, and confirm the cloud icon next to it is GRAY, not orange. If it is orange, click it once to switch to gray, then wait another 10 minutes.

If the status remains stuck after another 15 minutes:

- Take a screenshot of the Cloud Run Domain Mappings page (showing the status).
- Take a screenshot of the Cloudflare DNS record for `wedflix` (showing the gray cloud).
- Send both screenshots to the user.

✓ DONE

Phase 4 done when the status for `wedflix.qpix.co.in` shows OK (green) on the Cloud Run Domain Mappings page.

Phase 5 — Final verification test

Goal: confirm the site loads on the new URL with valid SSL.

Time: about 1 minute.

Step 5.1 — Open the site in a browser

1. Open a new **incognito** / **private** browser window. (This avoids any cached state from earlier testing.)
2. Visit: <https://wedflix.qpix.co.in>

Step 5.2 — Confirm all three of these

- The WEDFLIX wedding platform homepage loads.
- The address bar shows a  padlock icon (or “Connection is secure” when you click on it).
- There are no “Not secure” or red-triangle warnings anywhere.

✓ DONE

If all three are true, DNS mapping is complete. Take a screenshot of the browser showing the WEDFLIX homepage at the new URL with the padlock visible, and send to the user.

6. Troubleshooting

Problem: Search Console says “DNS verification failed” (Phase 1)

Most likely cause: DNS has not propagated yet, or the TXT value was typed instead of pasted (a single character off will fail).

Fix: in Cloudflare, edit the TXT record and confirm the Content exactly matches the value from Search Console (use copy-paste, not retyping). Wait 5 more minutes and click Verify again.

Problem: Cloud Run status stuck on “Certificate provisioning” for more than 20 minutes (Phase 4)

Most likely cause: the Cloudflare proxy is on (orange cloud) instead of DNS only (gray cloud). Google cannot see the real CNAME through the proxy.

Fix: in Cloudflare DNS, find the wedflix CNAME and click the cloud icon next to it until it turns GRAY. Wait another 10 minutes.

Problem: Browser shows “Your connection is not private” / SSL error

Most likely cause: certificate has not finished provisioning yet.

Fix: wait 10 to 15 more minutes, then refresh. Check the Cloud Run Domain Mappings page status — proceed only when it shows OK (green).

Problem: 404 “Not Found” at <https://wedflix.qpix.co.in>

Most likely causes (check each in order):

- Cloudflare proxy is on (orange cloud). Switch to DNS only (gray cloud).
- CNAME target is wrong. Confirm it is exactly ghs.googlehosted.com — no typos, no extra characters.
- Cloud Run domain mapping was not saved. Reopen Cloud Run Domain Mappings page and confirm wedflix.qpix.co.in is listed.

Problem: “Domain not verified for this user” error when creating mapping (Phase 2)

Cause: you are signed in to Cloud Console with a different Google account than the one that verified the domain in Search Console.

Fix: sign out of all Google accounts, then sign in to both Cloud Console and Search Console with the SAME account.

7. Final Checklist

Before reporting completion, confirm every item below is true. Send a screenshot of each as evidence.

- ☐ Search Console shows “Ownership verified” for qpix.co.in.
- ☐ Cloudflare DNS shows the TXT record from Phase 1.
- ☐ Cloud Run > Domain Mappings shows wedflix.qpix.co.in with status **OK (green)**.

- ☐ Cloudflare DNS shows the CNAME `wedflix → ghs.googlehosted.com` with a **GRAY cloud** icon (DNS only).
- ☐ <https://wedflix.qpix.co.in> loads in a browser with a valid  padlock.

8. What to send the user when finished

Reply with the message “DNS mapping complete” plus the following four screenshots, in order:

1. Search Console showing “Ownership verified” for `qpix.co.in`.
2. Cloud Run Domain Mappings page showing `wedflix.qpix.co.in` status = OK (green).
3. Cloudflare DNS records page showing both the verification TXT and the `wedflix` CNAME (with gray cloud).
4. Browser screenshot of <https://wedflix.qpix.co.in> loaded successfully with the SSL padlock visible.

— End of guide —
